

Steps of the Scientific Method

Martyn Shuttleworth 359.9K reads

The steps of the scientific method were developed over millennia, since the time of the ancient Greek and Persian philosophers.

Whilst there are always minor variations between different scientific disciplines, they all follow the same basic path.

The banner features the Explorable logo (a flask icon) and the text 'EXPLORABLE Quiz Time!' in white on an orange background. Below the logo are three quiz cards:

- Quiz: Psychology 101 Part 2 (with an image of red roller skates)
- Quiz: Psychology 101 Part 2 (with an image of colorful pencils)
- Quiz: Flags in Europe (with an image of a Ferris wheel)

A link 'See all quizzes =>' is located at the bottom right of the banner.

General Question

The starting point of most new research is to formulate a general question about an area of [research](#) [1] and begin the process of [defining it](#) [2].

This initial question can be very broad, as the later research, observation and narrowing down will hone it into a [testable hypothesis](#) [3].

For example, a broad question might ask 'whether fish stocks in the North Atlantic are declining or not', based upon general observations about smaller yields of fish across the whole area. Reviewing previous research will allow a general overview and will help to establish a more specialized area.

Unless you have an unlimited budget and huge teams of scientists, it is impossible to research such a general field and it needs to be pared down. This is the method of trying to sample one small piece of the whole picture and gradually contribute to the wider question.

Narrowing Down

The research stage, through a process of elimination, will narrow and focus the research area.

This will take into account budgetary restrictions, time, available technology and practicality, leading to the proposal of a few realistic [hypotheses](#) [4].

Eventually, the researcher will arrive at one fundamental hypothesis around which the experiment can be [designed](#) [5].

Designing the Experiment

This stage of the scientific method involves designing the steps that will [test](#) [3] and evaluate the hypothesis, [manipulating](#) [6] one or more [variables](#) [7] to generate analyzable data.

The experiment should be designed with later [statistical tests](#) [8] in mind, by making sure that the experiment has controls and a large enough sample group to provide statistically valid results.

Observation

This is the midpoint of the [steps of the scientific method](#) [9] and involves observing and recording the results of the research, gathering the findings into raw data.

The observation stage involves looking at what effect the [manipulated variables](#) [6] have upon the subject, and recording the results.

Analysis

The scope of the research begins to broaden again, as statistical analyses are performed on the data, and it is organized into an understandable form.

The answers given by this step allow the further widening of the research, revealing some trends and answers to the initial questions.

Conclusions and Publishing

This stage is where, technically, the [hypothesis](#) [4] is stated as proved or disproved.

However, the bulk of research is never as clear-cut as that, and so it is necessary to filter the results and state what happened and why. This stage is where interesting results can be earmarked for further research and adaptation of the initial hypothesis.

Even if the hypothesis was incorrect, maybe the experiment had a flaw in its [design](#) [10] or implementation. There may be trends that, whilst not [statistically significant](#) [11], lead to further research and refinement of the process.

The results are usually published and shared with the scientific community, allowing verification of the findings and allowing others to continue research into other areas.

Cycles

This is not the final stage of the steps of the [scientific method](#) [12], as it generates data and ideas to recycle into the first stage.

The initial and wider research area can again be addressed, with this research one of the many individual pieces answering the whole question.

Building up understanding of a large area of research, by gradually building up a picture, is the true path of scientific advancement. One great example is to look at the work of [J J Thomson](#) [13], who gradually inched towards his ultimate answer.
